DTC P007C:00 [SKYACTIV-D 2.2]

id0102s4210800

| DTC P007C: 00 | Boost air temperature sensor circuit low input |
|------------------------|--|
| DETECTION CONDITION | If the PCM detects that the boost air temperature sensor voltage at the PCM terminal 1CM is 0.10 V or less for 1 s with the following condition met, the PCM determines that the boost air temperature sensor circuit voltage is low. MONITORING CONDITIONS Battery voltage: 8—20 V Diagnostic support note • This is a continuous monitor (CCM). • The check engine light illuminates if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA (Mode 2)/Snapshot data is available. • DTC is stored in the PCM memory. |
| FAIL-SAFE FUNCTION | PCM restricts engine torque. Inhibits the two-stage turbo control. Inhibits the EGR control. Inhibits the diesel particulate filter regeneration control. Inhibits engine-stop by operating the i-stop function. PCM restricts engine-transaxle integration control. |
| POSSIBLE CAUSE | Intake air temperature is too high Boost air temperature sensor connector or terminals malfunction Boost air temperature sensor malfunction Short to ground in wiring harness between boost air temperature sensor terminal A and PCM terminal 1CM PCM connector or terminals malfunction Boost air temperature sensor signal circuit and ground circuit are shorted to each other PCM malfunction |
