DTC P2243:00	A/F sensor reference voltage circuit open
DETECTION	 The PCM monitors the A/F sensor signal voltage at the PCM terminal 1W. If either of the following conditions is met, the PCM determines that the A/F sensor reference voltage circuit is open. The PCM terminal 1W voltage is above 5.3 V for 30 s. The PCM detects DTC P0134:00 while the pending code P2243:00 is stored. MONITORING CONDITIONS Drive Mode 03 (Variable Valve Timing, A/F Sensor Heater, HO2S Heater, A/F Sensor, HO2S and TWC Repair Verification Drive Mode) Following conditions are met: Engine is running Battery voltage: 11—18 V A/F sensor element impedance: specified or more Diagnostic support note This is a continuous monitor (A/F sensor, HO2S). The check engine light illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. PENDING CODE is available if the PCM detects the above malfunction condition during first drive cycle. FREEZE FRAME DATA (Mode 2)/Snapshot data is available. The DTC is stored in the PCM memory.
FAIL-SAFE FUNCTION	Fixes the duty value of the A/F sensor heater. Stops the fuel feedback control.
POSSIBLE CAUSE	 A/F sensor connector or terminals malfunction PCM connector or terminals malfunction Open circuit in wiring harness between A/F sensor terminal F and PCM terminal 1W A/F sensor malfunction PCM malfunction
