DTC P0183:00	Fuel temperature sensor circuit high input				
DETECTION CONDITION	 The PCM monitors the fuel temperature sensor signal. If the PCM detects that the fuel temperature sensor voltage at the PCM terminal 1CU is above 4.90 V for 1 s, the PCM determines that the fuel temperature sensor circuit has a malfunction. MONITORING CONDITIONS Battery voltage: 8—20 V Diagnostic support note This is an intermittent monitor (fuel system). The check engine light illuminates if the PCM detects the above malfunction condition during the first drive cycle. FREEZE FRAME DATA (Mode 2)/Snapshot data is available. DTC is stored in the PCM memory. 				
FAIL-SAFE	Inhibits engine-stop by operating the i-stop function.				
FUNCTION • PCM restricts engine-transaxle integration control.					
Ambient temperature is too low Fuel temperature sensor connector or terminals malfunction PCM connector or terminals malfunction Short to power supply in wiring harness between fuel temperature sensor terminal A and PCM terminals: Open circuit in wiring harness between the following terminals: Fuel temperature sensor terminal A—PCM terminal 1CU Fuel temperature sensor terminal B—PCM terminal 1CV Fuel temperature sensor malfunction PCM malfunction
